

To whom it may concern

I n my area, Glenwood Springs, CO I have the ability to have either satellite service or UHF transmission only. I had satellite service for awhile but was disattified with the service so I dropped it, February. I can obtain a GrandJunction channel on VHF 3, which has the CBS feed. I am also able to get the second Grand JUnction channel with the NBC feed. If I adjust the antenna just right I am able to get the ABC feed. Up until last month I was also able to get the PBS channel on UHF with the best clarity of all of the uhf channels. Then around the end of March I began to get erratic noise on the PBS channel which caused significant distortion, like an AC wave, and introduction of noise. No amount of antenna repositioning will solve the problem. Sometimes , early in the morning, 5:00am the problem goes away, then reappears at night when I want to watch PBS. The cable and sattelite companies banded together to "take down" our translator on a neighboring mountain years ago. I want to know if some force is acting to distort the "free" pbs channel in this area. I even purchased an expensive terk UHF antenna to see if that solve the problem but the distortion continued. Can you investigate.?
